**Acids and Bases**

## Acids and Bases

- Acids are substances that turn **blue litmus red** and **react** with metals like Zinc, thus releasing **hydrogen gas**.
- **Hydrochloric Acid (HCl), Sulfuric Acid (H<sub>2</sub>SO<sub>4</sub>) and Nitric Acid (HNO<sub>3</sub>) are all examples of strong acids**
- **Bases** are substances which turn **red litmus blue**.
- **Sodium hydroxide (NaOH), sodium carbonate (Na<sub>2</sub>CO<sub>3</sub>) and ammonia (NH<sub>3</sub>) are examples of bases.**
- A base that **dissolves in water** are known as an **alkali**.
- Sodium hydroxide is an alkali; therefore sodium hydroxide solution is obviously **alkaline**.

**Everyday acids:** Vinegar, lactic acid in milk as it goes sour, citrus fruits & hydrochloric acid in the stomach necessary for digestion and killing micro organisms

**Everyday bases:** oven cleaner, bleach, caustic soda, toothpaste & washing up liquid.

**Laboratory acids:** Hydrochloric Acid (HCl), Sulfuric Acid (H<sub>2</sub>SO<sub>4</sub>) and Nitric Acid (HNO<sub>3</sub>)

**Laboratory bases:** Sodium hydroxide (NaOH), sodium carbonate (Na<sub>2</sub>CO<sub>3</sub>) and ammonia (NH<sub>3</sub>)

Bases → neutralise acids  
 Alkalis → water soluble bases

### Monobasic, dibasic and tribasic acids:

**Monobasic acids:** Refers to an acid which donates one proton per molecule e.g. HCl and HNO<sub>3</sub>

**Dibasic acids:** Refers to an acid which donates 2 protons per molecule e.g. H<sub>2</sub>SO<sub>4</sub>

**Tribasic acids:** Refers to an acid which donates 3 protons per molecule e.g. H<sub>3</sub>PO<sub>4</sub>

### Arrhenius theory of an acid:

- He suggested that an acid is a substance which dissociates in aqueous solution to form H<sup>+</sup> ions :  $\text{HX}_{(aq)} \rightarrow \text{H}^+ + \text{X}^-$

#### **Note:**

- In solution, strong acids and bases are fully dissociated and weak acids and bases partially dissociated.
- A base (MOH) dissociates in water to form a hydroxide ion and a cation:  $\text{MOH} \rightarrow \text{OH}^- + \text{H}^+$

### More examples of conjugate base formations

#### Strong acid:

- This is an acid which dissociates fully into ions in an aqueous solution e.g.  $\text{HCl} \rightarrow \text{H}^+ + \text{Cl}^-$
- Every HCl molecule breaks up into ions

#### Weak acid:

- This is an acid which only slightly dissociates into ions in a aqueous solution  
e.g.:  $\text{CH}_3\text{COOH} (\text{aq}) \rightarrow \text{CH}_3\text{COO}^- + \text{H}^+$
- Very few of these acid molecules dissociates or break up into ions

#### Q) Why is $\text{H}_2\text{SO}_4$ considered to be a strong acid?

- This acid fully dissociates into ions when in an aqueous solution
- It has a great tendency to break/ give protons

#### Q) Explain why strong acids form weak conjugate bases.

- A strong acid such as sulphuric acid readily donates a proton and forms a conjugate base  $\text{HSO}_4^-$
- The conjugate base i.e.  $\text{HSO}_4^-$  is a weak base as it does not readily accept a proton

#### Q) Show that a conjugate base $\text{H}_2\text{SO}_4$ can itself act as an acid

- The  $\text{H}_2\text{SO}_4$  loses a proton and forms the conjugate base  $\text{HSO}_4^-$

- The conjugate base  $\text{HSO}_4^-$  then donates a proton i.e. behaves as an acid

#### Q) What is a conjugate acid?

- Species formed when a base has accepted an  $\text{H}^+$  proton:  $\text{NH}_3 > \text{NH}_4^+$   
(base) (conj. Acid)

#### Q) Write a conjugate acid for the following

**Q) Define conjugate acid/bond pair**

- These are 2 substances which differ by an  $\text{H}^+$  or a proton. E.g.  $\text{HCl} \leftrightarrow \text{Cl}^-$

**Q) Indicate which species are acting as acids and bases in the following:**

**Amphoteric substances:**

- This is a substance which can behave as an acid or a base depending on what it reacts with

**e.g. 1)**  $\text{H}_2\text{O}$  behaves as a base (accepts a proton)

**e.g. 2)**  $\text{H}_2\text{O}$  molecules loses a proton (behaves as an acid)

**Acidity:** The acidity of a solution depends on the concentration of  $\text{H}^+$  ions in the solution

- $\text{H}^+$  concentration > more acidic the solution is
